Windows Utility Pack

One-page repo summary based only on repository evidence

WPF | .NET 10 | MVVM

What It Is

Local-first Windows desktop toolbox built with WPF and .NET 10. It brings 30+ utilities into one shell with shared navigation, theming, search, and persisted local settings.

Who It's For

Primary user/persona: **Not found in repo.** Based on the registered tool set and README, the app appears aimed at Windows power users, developers, and IT/support admins who want one utility hub.

How To Run

- Windows 10/11 and .NET 10 SDK
- `dotnet restore WindowsUtilityPack.sln`
- `dotnet build WindowsUtilityPack.sln`
- `dotnet run --project src/WindowsUtilityPack/WindowsUtilityPack.csproj`
- Verify with `dotnet test tests/WindowsUtilityPack.Tests/WindowsUtilityPack.Tests.csproj`

What It Does

- Home dashboard with search, favorites, recents, quick actions, and live system vitals.
- 32 integrated tools across System Utilities, File & Data Tools, Security & Privacy, Network & Internet, Developer & Productivity, and Image Tools.
- System workflows for storage analysis, startup inspection, event logs, hotkeys, registry editing, task scheduling, and workspace profiles.
- File/data workflows for bulk renaming, hashing, secure deletion, metadata editing, and file split/join with checksum validation.
- Security and network helpers including password/hash tools, local secret vault, certificate tooling, ping, DNS, ports, HTTP tests, speed tests, SSH, and downloads.
- Developer and image helpers including regex, clipboard/log/markdown/text conversion, QR, UUID/ULID, JSON/YAML validation, diffing, image conversion, and screenshot annotation.

How It Works

- `App.xaml.cs` is the composition root: it creates shared services, loads settings, applies the selected theme, and starts global hotkeys.
- `ToolBootstrapper.RegisterTools()` registers tool metadata and ViewModel factories in `ToolRegistry`.
- `NavigationService` resolves a tool key to a fresh ViewModel instance; it raises navigation events and maintains a small back stack.
- `MainWindow.xaml` hosts a `ContentControl` bound to `CurrentView`; `App.xaml` `DataTemplates` map each ViewModel to its matching View.
- Services under `src/WindowsUtilityPack/Services/` handle domain logic and persistence. README evidence shows data stored under `%LOCALAPPDATA%\WindowsUtilityPack` and `%APPDATA%\WindowsUtilityPack`.

Evidence: README.md, src/WindowsUtilityPack/App.xaml(.cs), ToolBootstrapper.cs, Tools/ToolRegistry.cs, Services/NavigationService.cs
